

MHV Single, Dual and Triple DC-DC Converters

28 VOLT INPUT – 15 WATT

FEATURES

- No cross regulation on dual outputs
- Trim single output models from 110% to 80% depending on model
- Operating temperature -55°C to +125°C
- Input voltage range 16 to 50 volts
- Transient protection 80 V for 120 ms
- 12 V_{OUT} single and dual to 75 volts
- 15 V_{OUT} single and dual to 60 volts
- Fully isolated
- Fixed frequency switching
- Inhibit and sync functions
- Undervoltage lockout

DESCRIPTION

The Interpoint® MHV Series™ of DC-DC converters offers up to 15 watts of power in a low profile package. The MHV converters are manufactured in our fully certified and qualified MIL-PRF-38534 Class H production facility and packaged in hermetically sealed steel cases. They are ideal for use in programs requiring high reliability, small size, and high efficiency. The series offers a wide input voltage range of 16 to 50 volts and a choice of nine different output voltage configurations comprised of single, dual or triple outputs. The 3.3 volt single, 5 volt single and dual and the triple output models will withstand transients of up to 80 volts for up to 120 milliseconds while maintaining output voltages. The 12 volt single and dual outputs will withstand transients up to 75 volts and the 15 volt single and dual outputs will withstand up to 60 volts for 120 milliseconds. The MHV Series operates at 15 watts of output power (10 watts for the 3.3 volt single output) over the military temperature range of -55°C to +125°C while maintaining low input and output noise.

CONVERTER DESIGN

MHV Series DC-DC converters are switching regulators that use continuous flyback conversion topology with a clock frequency of approximately 600 kHz. MHV Series converters incorporate two pulse width modulators (PWM) with one PWM phase shifted 180° from the other to create a dual phase/phase-shifted operation. Each of the PWMs operates at approximately one-half (300 kHz) of the clock frequency. This proprietary technology minimizes input ripple and improves efficiency. On singles the output ripple is reduced. Cross regulation is eliminated on dual output models which are independently regulated and do not require load balancing or minimum loading. On triple output models, this design provides completely independent regulation with no cross regulation effect between the main and auxiliary outputs and no minimum loading is required on the main output.

The dual models can be used as a single output voltage by connecting the load between positive and negative outputs, leaving the common unconnected, resulting in double the output voltage. (for example, MHV2815D can be used as a 30 volt output.) When using a dual to double the output voltage (span voltage) the maximum load capacitance across the span voltage is half that specified for each output.

INHIBIT FUNCTION

The converter is enabled when the inhibit terminal is left unconnected. When the inhibit terminal is pulled low (<0.8 V) the converter shuts down, typically drawing 8.4 mA at 28 V_{IN} or 15 mA at 50 V_{IN}. Sink current required is V_{IN} / 3.3 k ohm. For more information see Table 7 on page 7.

SYNCHRONIZATION FUNCTION

Applying an external signal of 40% to 60% duty cycle and 490 to 710 kHz for single and dual output models will synchronize the converter to your system requirements. For triple output models the external frequency range is 500 to 700 kHz. Free run clock frequency is approximately 600 kHz. If not used, the sync terminal must be left unconnected. See Table 7 on page 7

TRIM

Single output converters feature a trim range of as low as 80% to as high as 110% of V_{OUT} nominal, depending on the model. To trim up, connect a resistor from Output Common (pin 4) to Trim (pin 3). To trim down, connect a resistor from the Positive Output (pin 5) to Trim (pin 3). For more information see Table 1, Table 2 and Figure 6 on page 4.

MHV Single, Dual and Triple DC-DC Converters

28 VOLT INPUT – 15 WATT

SHORT CIRCUIT PROTECTION

Singles

The output current will be limited by approximately 140% of full load and can sustain indefinite short circuit protection. Restart is automatic upon removal of the short circuit.

Duals and Triples

The converter will limit the output power by decreasing the output voltage as the output current increases under conditions of approximately 180% of full load current for duals and 150% of full load current for triples. Short circuit duration should be brief to prevent excessive internal temperature rise. Restart is automatic upon removal of the short circuit.

UNDERVOLTAGE LOCKOUT

An undervoltage lockout of approximately 7 volts keeps system current levels low during startup. Low line dropout typically occurs at approximately $12 V_{IN}$ to $17 V_{IN}$ depending on model. See "Figure 13" and "Figure 14" on page 13 and "Figure 23" on page 14.

SCREENING

The converters are offered with standard screening, "ES" screening, or fully compliant to "883" MIL-PRF-38534 Class H screening. See Table 13 on page 20 and Table 14 on page 21. Standard microcircuit drawings (SMD) are available. See Table 5 on page 6.

TABLE 1: TRIM TABLE

$$\text{Trim down: } R_T \text{ (k}\Omega\text{)} = \left(\frac{V_o - 2.5}{V_o \text{ nominal} - V_o} \right) A - B$$

$$\text{Trim up: } R_T \text{ (k}\Omega\text{)} = \left(\frac{2.5 A}{V_o - V_o \text{ nominal}} \right) - B$$

V_O = desired output voltage

FORMULA 1: MHV SINGLE OUTPUT TRIM

FORMULA VALUE BY MODEL				
MODEL	3.3 V	5 V	12 V	15 V
A	3.7	3.7	14	18.2
B	10	10	30	30

TABLE 2: FORMULA VALUES BY MODEL

FIGURE 6: MHV SINGLE OUTPUT TRIM

Notes

If calculated result is a negative value, the desired output voltage is outside the allowed trim range.

Calculated values of R_T are ±15%.

When trimming up, do not exceed the maximum output power.

When trimming down, do not exceed the maximum output current.

 For exact specifications for an SMD product, refer to the SMD drawing. SMDs can be downloaded from <https://landandmaritimeapps.dla.mil/programs/smcr>

TABLE 5: SMD CROSS REFERENCE

MODEL NUMBER OPTIONS ¹					
TO DETERMINE THE MODEL NUMBER ENTER ONE OPTION FROM EACH CATEGORY IN THE FORM BELOW.					
CATEGORY	Base Model and Input Voltage	Output Voltage ²	Number of Outputs ³	Case Option ⁴	Screening ⁵
OPTIONS	MHV28	3R3, 05, 12, 15	S	(non-flanged, leave blank)	Standard (leave blank) /ES
		05, 12, 15	D		
		512, 515	T	F (flanged)	/883 (Class H)
FILL IN FOR MODEL # ⁶	MHV28	_____	_____	_____	/ _____

Notes

- See Figure 9, above, for an example of a model number.
- Output Voltage: An R indicates a decimal point. 3R3 is 3.3 volts out. The value of 3R3 is only available in single output models. The 512 and 515 triple output converters are +5 volt main and ±12 or ±15 volt auxiliaries.
- Number of Outputs: S is a single output, D is a dual output, and T is a triple output
- Case Options: For the standard case (non-flanged, Figure 30 on page 17 and Figure 29 on page 16) leave the case option blank. For the flanged case (Figure 32 on page 19 and Figure 31 on page 18) use an F in the case option.
- Screening: For standard screening leave the screening option blank. For other screening options, insert the desired screening level. For more information see Table 13 on page 20 and Table 14 on page 21.
- If ordering by model number add a “-Q” to request solder dipped leads (MHV28512TF/883-Q). Available only for Class H.

Notes

1. Guaranteed by characterization test and/or analysis. Not a production test.
2. Current limit is defined as the point at which the output voltage decreases by 1%.
Singles limit the current to the value specified and have indefinite short circuit protection.

Duals and triples limit the power to the value specified. The output current will increase but the output voltage will decrease to prevent the output power from increasing. Due to the high currents the duals and triples do not have indefinite short circuit protection. Each output of the duals is independent. The auxiliary is independent from the main on the triples.

3. An external inhibit interface should be used to pull the inhibit low or leave it floating. The inhibit pin can be left unconnected if not used.

4. Sinking current required is $V_{IN} / 3.3 \text{ k}\Omega$.

Notes

- Guaranteed by characterization test and/or analysis. Not a production test.
- The sum of the 12 volt auxiliary output currents may not exceed 416 mA.
- The sum of the auxiliary output power may not exceed 5 watts. Up to 80% of the total power (5W) is available from either auxiliary providing the opposite auxiliary is carrying 20% of the total auxiliary power used.
- Load regulation for the +5 is specified at 0.0 to 2.0 A with the aux. both held at 2.5 W (208 mA). Load regulation for the auxiliary is specified as both auxiliaries from 0.0 to 2.5 W (208 mA) at the same time with the +5 held at 2.0 A.
- Cross regulation occurs between the two auxiliaries and is measured on -aux. +5 is held constant at 2.0 A. Cross regulation is specified for two conditions:
 - Positive aux. = 2.5 W (50%); negative aux. = 2.5 W to 0.5 W (50% to 10%).
 - From +Po = 70% and -Po = 30% to + Po = 30% and -Po = 70%.
 Above conditions are referenced to 50%/50% balanced loads.
- At inputs above 40 volts with temperatures above approximately 100°C, to ensure start-up, transition time should be greater than 5 ms and use of the inhibit function should be avoided.
- Load fault is a short circuit (<50 mΩ). Recovery is into a resistive load.
- Recovery and start-up times are measured from application of the transient or change in condition to the point at which V_{OUT} is within 1% of final value.
- Step load test is performed at 10 microseconds typical.
- Step line test is performed at 100 microseconds ± 20 microseconds.
- Tested on release from inhibit.
- Applicable to each output. No effect on dc performance.

FIGURE 28

MHV Single, Dual and Triple DC-DC Converters

28 VOLT INPUT – 15 WATT

Weight: 60 grams maximum

Case dimensions in inches (mm)

Tolerance ± 0.005 (0.13) for three decimal places
 ± 0.01 (0.3) for two decimal places
 unless otherwise specified

CAUTION

Heat from reflow or wave soldering may damage the device.
 Solder pins individually with heat application not exceeding 300°C for 10 seconds per pin.

Materials

Header Cold Rolled Steel/Nickel/Gold
 Cover Kovar/Nickel
 Pins #52 alloy/Gold ceramic seal
 Gold plating of 50 - 150 microinches included in pin diameter
 Seal hole 0.120 \pm 0.002 (3.05 \pm 0.05)

Case F1 MHV T, Rev G, 2014.01.13
 Please refer to the numerical dimensions for accuracy.

FIGURE 29: CASE F1 - MHV TRIPLE

Test methods are referenced to MIL-STD-883 as determined by MIL-PRF-38534.

Notes

- Standard and ES are non-QML products and may not meet all of the requirements of MIL-PRF-38534.
- All processes are QML qualified and performed by certified operators.
- Not required by DLA but performed to assure product quality.
- Burn-in temperature designed to bring the case temperature to +125°C minimum.
Burn-in is a powered test.
